

Parallax

Formula and units for python

- Gaia at Lagrange L2: 1.01 au from sun-> 149597870700 m = 1 au
- So in $D=2d/\alpha$, $2d= 302187698814$ m
- def parsec=648 000/pi au

1. We know:

$pc \Rightarrow$ parsec ; $au \Rightarrow$ astronomical unit (*distance earth-sun*)

$$1pc := \frac{648\,000}{\pi} au$$
